

ID's (RFQ-hub) is a software editor specialized in electronic trading platforms; we've got datacenters in various countries, but the job is based in the center of Paris (2nd arr.)

We're looking for a lead system administrator to help us build a robust and free of single point of failure architecture that will keep our users happy and their data safe.

Apart from imagining absurd "what if" scenarios that could bring our platform down and ways to keep it up "if" needed, you will:

- Take part in new projects with a sysadmin component (vpn, leased lines, etc)
- Make the lives of the development and the sales team pain-free.
- Monitor our software and hardware environment and detect issues before they become problematic.

Desired skills:

- Microsoft server ecosystem : Windows Server, Active Directory, Exchange, PowerShell, etc.
- Strong SQL Server Administration skills (mirroring, replication, profiling, etc.)
- Networking (leased lines, VPN, routers, etc)
- Good knowledge of SQL and notions of c#/.net
- Strong communication skills.
- Attitude of getting things done, and changing the process if process is wrong.
- Start-up mentality / table soccer skills

Our users are paranoid about security and uptime, and so are we. If you want to help us take this mindset to the next level, RFQ-hub is for you!
